

ZONKE REDEVELOPMENT PROJECT

TEAM 1 — REQUIREMENTS & PLANNING

Field	Details
System Developers	Tsihifirwa Mohau Mariba; Thando Frank Sithole
Role	Requirements & Planning
Main Responsibility	Define what the new Zonke application must do and what the first prototype will contain.
Tools / Technologies	Google Docs / Word; GitHub; flowchart or diagram tool; current Zonke website as a reference.

1. What You Must Do

Task	Instruction
1. Identify users	Define the main users of the application, such as clients and freelancers, and describe what each user needs to achieve.
2. Define features	List the important functions the new application needs. Separate core prototype features from features that can be developed later.
3. Write user stories	Describe important features from the user's point of view, for example: as a client, I want to browse freelancers so that I can find suitable skills.
4. Create user flows	Map the main steps users follow through the application, including important decisions and outcomes.
5. Set prototype scope	Agree which features must be working in the first prototype and which features are outside the first prototype.
6. Prepare requirements	Give the UI/UX, frontend and backend teams clear requirements they can use to begin development.
7. Create GitHub issues	Turn agreed work into clear development tasks or GitHub issues that can be assigned and tracked.

2. Work in This Order

Step	What to do
1. Understand	Review the existing Zonke site and the project direction.
2. Define	Define users, requirements and important features.
3. Map	Create user stories and core user flows.
4. Scope	Prioritise what must be included in the first prototype.
5. Handover	Give the other teams clear requirements and GitHub tasks.

3. Computer and Project Setup

Item	Instruction
Computer	Use a reliable computer with enough storage for the development tools, project files and Git repository. Keep the operating system and browser updated.
Code editor	Install VS Code or another editor you already understand. Make sure extensions required for your chosen technology are installed.
Git	Install Git and configure your name and email. Confirm that you can clone, pull, commit and push to the project repository.
GitHub	Use the shared Zonke repository. Work on your own branch where the team workflow requires it, pull before starting work, and commit regularly.
Browser	Use a modern browser such as Chrome, Edge or Firefox. Keep developer tools available for inspecting and testing the application.
Project folder	Create a clear local project folder. Do not keep the main project only on the desktop or in random folders.

Item	Instruction
Dependencies	Install only the packages, libraries, frameworks or tools actually required by the chosen technology. Record important setup steps so another System Developer can reproduce the environment.
Technology choice	Use technologies that the team understands and can explain. Do not choose a framework simply because it is popular or because AI suggested it.
Current Zonke site	Use the existing Zonke website as a reference for understanding the business, content and user journeys. The new application is being redeveloped from scratch.

4. Team-Specific Setup / Guidance

Area	Instruction
Project repository	All five teams contribute to the same Zonke development project. Do not create separate unrelated versions of the application.
Team communication	Keep the other teams informed about decisions, dependencies, changes to requirements and anything that may affect their work.
Use of AI	AI can help with explanations, ideas and troubleshooting, but it must not replace your understanding. Check, test and adapt any AI-generated material before using it.
Do not change business decisions	Do not invent or change the business model, target market, payment approach, user-data requirements, domain or hosting decisions without confirmation from the project/CTO direction.
Documentation	Keep requirements simple and specific. Avoid long theoretical explanations that do not help the development teams build the application.
Traceability	Each important requirement should connect to a feature, user story or GitHub issue so the team can see what is being built and why.

5. By Friday

Required Output	What should be available
Requirements / features document	A clear list of users, features and functional requirements for the prototype.
User stories	Core user stories for the main client and freelancer journeys.
User flows	Clear diagrams for the main user journeys.
Prototype scope	Prioritised must-have features and later features.
GitHub tasks	Development tasks/issues that the other teams can start working from.

6. Working Rules

Rule	Instruction
GitHub	Commit regularly. Commit messages must describe the work completed. Each System Developer must be able to show their own contribution.
Communication	Tell the other teams when work is ready, blocked or dependent on another team's work.
Evidence	Keep useful evidence such as screenshots, designs, code commits, test results, diagrams or API results. Evidence should prove what was actually done.
Understanding	Do not copy and paste work from AI without understanding it. You must be able to explain your code, design decisions, tests and recommendations.
Professional practice	Keep files organised, use clear names, avoid unnecessary duplication, and ask for help when you are genuinely blocked.
Build from scratch	The new Zonke application is a fresh redevelopment. The existing website is a reference point, not a codebase that must be copied.
