

ZONKE REDEVELOPMENT PROJECT

TEAM 3 — FRONTEND DEVELOPMENT

Field	Details
System Developers	Mhlastsi David, Felicity Lungelo
Role	Frontend Developers
Main Responsibility	Build the visible and interactive part of the new Zonke application from the approved UI/UX designs.
Tools / Technologies	VS Code; Git; GitHub; browser; chosen frontend technology. HTML/CSS/JavaScript or a suitable framework may be used if understood.

1. What You Must Do

Task	Instruction
1. Set up development environment	Install and test the required editor, Git, runtime and dependencies for the chosen frontend technology.
2. Create project structure	Set up a clean project structure with sensible folders and files.
3. Build core layout	Implement the shared layout, navigation, header, footer and other reusable elements required by the prototype.
4. Build prototype pages	Develop the priority screens from the approved UI/UX designs.
5. Add interactions	Implement required client-side interactions such as navigation, forms, validation, menus and other agreed behaviour.
6. Make responsive	Test and adjust the application for different screen sizes.
7. Integrate	Connect frontend components to backend endpoints when those endpoints become available.
8. Commit work	Commit meaningful changes regularly and keep the repository in a usable state.

2. Work in This Order

Step	What to do
1. Setup	Prepare the development environment and repository.
2. Structure	Create the frontend project structure.
3. Build	Implement the priority screens and reusable components.
4. Connect	Add interactions and connect to backend services where ready.
5. Check	Run browser and responsive checks and fix issues.
6. Share	Commit and push work so other teams can review and test it.

3. Computer and Project Setup

Item	Instruction
Computer	Use a reliable computer with enough storage for the development tools, project files and Git repository. Keep the operating system and browser updated.
Code editor	Install VS Code or another editor you already understand. Make sure extensions required for your chosen technology are installed.
Git	Install Git and configure your name and email. Confirm that you can clone, pull, commit and push to the project repository.
GitHub	Use the shared Zonke repository. Work on your own branch where the team workflow requires it, pull before starting work, and commit regularly.
Browser	Use a modern browser such as Chrome, Edge or Firefox. Keep developer tools available for inspecting and testing the application.

Item	Instruction
Project folder	Create a clear local project folder. Do not keep the main project only on the desktop or in random folders.
Dependencies	Install only the packages, libraries, frameworks or tools actually required by the chosen technology. Record important setup steps so another System Developer can reproduce the environment.
Technology choice	Use technologies that the team understands and can explain. Do not choose a framework simply because it is popular or because AI suggested it.
Current Zonke site	Use the existing Zonke website as a reference for understanding the business, content and user journeys. The new application is being redeveloped from scratch.

4. Team-Specific Setup / Guidance

Area	Instruction
Project repository	All five teams contribute to the same Zonke development project. Do not create separate unrelated versions of the application.
Team communication	Keep the other teams informed about decisions, dependencies, changes to requirements and anything that may affect their work.
Use of AI	AI can help with explanations, ideas and troubleshooting, but it must not replace your understanding. Check, test and adapt any AI-generated material before using it.
Do not change business decisions	Do not invent or change the business model, target market, payment approach, user-data requirements, domain or hosting decisions without confirmation from the project/CTO direction.
Technology choice	Choose a frontend approach that matches the team's current skills and the project requirements. Do not introduce a framework unless you understand the basic project structure and can explain why it is being used.
Local testing	Run the application locally and confirm that the main routes/pages load correctly before pushing changes.
Dependencies	Keep package/dependency files committed where appropriate so another System Developer can install the same environment.
Code quality	Use meaningful variable, component and file names. Avoid copying large blocks of code without understanding how they work.

5. By Friday

Required Output	What should be available
Running frontend	A working frontend prototype that can be opened and demonstrated locally.
Priority screens	The main agreed prototype screens implemented from the UI/UX design.
Navigation	Working navigation between the available screens.
Responsive layout	Initial responsive behaviour checked on different screen sizes.
GitHub contribution	Commits showing the work completed by each System Developer.

6. Working Rules

Rule	Instruction
GitHub	Commit regularly. Commit messages must describe the work completed. Each System Developer must be able to show their own contribution.
Communication	Tell the other teams when work is ready, blocked or dependent on another team's work.
Evidence	Keep useful evidence such as screenshots, designs, code commits, test results, diagrams or API results. Evidence should prove what was actually done.
Understanding	Do not copy and paste work from AI without understanding it. You must be able to explain your code, design decisions, tests and recommendations.
Professional practice	Keep files organised, use clear names, avoid unnecessary duplication, and ask for help when you are genuinely blocked.

Rule	Instruction
Build from scratch	The new Zonke application is a fresh redevelopment. The existing website is a reference point, not a codebase that must be copied.
