

Zonke — Student GitHub Setup

Before Students Clone

Before students begin, the facilitator should complete the following steps:

1. Add each student as a collaborator to the **Zonke GitHub repository**.
2. Ask students to accept their GitHub invitations.
3. Confirm that every student can access the `zonke` repository.

Clone the Repository

1. Open the Zonke repository on GitHub

Open the shared Zonke repository in a web browser.

2. Click the green Code button

The **Code** button is located near the top of the repository page.

3. Select HTTPS

In the Code menu, select the **HTTPS** option.

4. Copy the repository URL

Copy the repository URL. It will look similar to:

```
https://github.com/YOUR-USERNAME/zonke.git
```

Replace `YOUR-USERNAME` with the actual GitHub account or organisation name if necessary.

5. Open VS Code

Open Visual Studio Code and select:

Terminal → **New Terminal**

6. Clone the repository

Type the following command into the terminal:

```
git clone https://github.com/YOUR-USERNAME/zonke.git
```

Press **Enter**.

Git will download the Zonke repository onto the student's computer.

Open the Project

In VS Code, select:

File → **Open Folder** → select **zonke**

Students should see a project structure similar to:

```
zonke/  
├── frontend/  
├── backend/  
├── database/  
├── tests/  
├── docs/  
├── README.md  
└── .gitignore
```

Important: Use the Shared Repository

Students **must not create their own repositories** for this project.

Everyone works from the same:

Zonke GitHub Repository

Each student works on their own computer and later pushes their work back to the shared GitHub repository.

Basic GitHub Workflow

The standard workflow is:

Clone → Create Branch → Work → Commit → Push → Pull Request → Review → Merge

What the steps mean

- **Clone:** Download the shared repository to the student's computer.
- **Create Branch:** Create a separate branch for the task being completed.
- **Work:** Add or change files on the student's branch.
- **Commit:** Save the changes with a clear commit message.
- **Push:** Upload the branch to GitHub.
- **Pull Request:** Ask the team to review the changes.
- **Review:** Another student or facilitator checks the work.
- **Merge:** Add the approved work to the shared project branch.

Project Principle

One repository.
Ten computers.
One Zonke project.

Every contribution should support the same integrated Zonke application. Students should communicate with the team, keep their work organised, and use branches and pull requests rather than changing the shared project directly.
